1 Momentum distributions

2 Second quantization

This section will be somewhat over-elaborated. But it can serve as a recapitulation of second quantization.

The one body momentum distribution operator is defined as,

$$\hat{n}(p) = \frac{1}{(2\pi)^3} \int d^2 \Omega_{\mathbf{p}} a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} \tag{1}$$

It's action on a multi particle ground state $|\Phi\rangle$,

$$\langle \Phi | \hat{n}(p) | \Phi \rangle = \frac{1}{(2\pi)^3} \int d^2 \Omega_{\mathbf{p}} \langle \Phi | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle$$
 (2)

The creation and annihilation operators $a_{\mathbf{p}}^{\dagger}, a_{\mathbf{p}}$ have only meaning working on particles with definite momentum or the vacuum state $|0\rangle$.

$$\langle \Phi | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle = \int d^{3} \mathbf{p}_{1} \dots d^{3} \mathbf{p}_{A} \langle \Phi | \mathbf{p}_{1} \mathbf{p}_{2} \dots \mathbf{p}_{A} \rangle \langle \mathbf{p}_{1} \mathbf{p}_{2} \dots \mathbf{p}_{A} | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle$$
(3)

$$= \int d^{A} \mathbf{p}_{1} \dots d^{3} \mathbf{p}_{A} \langle \Phi | \mathbf{p}_{1} \mathbf{p}_{2} \dots \mathbf{p}_{A} \rangle \langle 0 | a_{\mathbf{p}_{1}} a_{\mathbf{p}_{2}} \dots a_{\mathbf{p}_{A}} a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle$$
(4)

Using the anticommutation relation $\{a_{\mathbf{p}}, a_{\mathbf{q}}^{\dagger}\} = \delta(\mathbf{p} - \mathbf{q})$, we get

$$\langle 0|a_{\mathbf{p}_{1}}a_{\mathbf{p}_{2}}\dots a_{\mathbf{p}_{A}}a_{\mathbf{p}}^{\dagger}a_{\mathbf{p}}|\Phi\rangle = \langle 0|a_{\mathbf{p}_{1}}a_{\mathbf{p}_{2}}\dots\delta(\mathbf{p}-\mathbf{p}_{A})a_{\mathbf{p}}|\Phi\rangle - \langle 0|a_{\mathbf{p}_{1}}a_{\mathbf{p}_{2}}\dots a_{\mathbf{p}_{A-1}}a_{\mathbf{p}}^{\dagger}a_{\mathbf{p}_{A}}a_{\mathbf{p}}|\Phi\rangle$$
(5)
$$= \delta(\mathbf{p}-\mathbf{p}_{A})\langle \mathbf{p}_{1}\mathbf{p}_{2}\dots\mathbf{p}|\Phi\rangle - \delta(\mathbf{p}-\mathbf{p}_{A-1})\langle 0|a_{\mathbf{p}_{1}}\dots a_{\mathbf{p}_{A-2}}a_{\mathbf{p}_{A}}a_{\mathbf{p}}|\Phi\rangle$$
(6)
$$+ \langle 0|a_{\mathbf{p}_{1}}\dots a_{\mathbf{p}_{A-2}}a_{\mathbf{p}}^{\dagger}a_{\mathbf{p}_{A-1}}a_{\mathbf{p}_{A}}a_{\mathbf{p}}|\Phi\rangle$$
(7)
$$= \delta(\mathbf{p}-\mathbf{p}_{A})\langle \mathbf{p}_{1}\mathbf{p}_{2}\dots\mathbf{p}_{A}|\Phi\rangle + \delta(\mathbf{p}-\mathbf{p}_{A-1})\langle \mathbf{p}_{1}\dots\mathbf{p}_{A-2}\mathbf{p}_{A-1}\mathbf{p}_{A}|\Phi\rangle$$
(8)

$$+ \langle 0|a_{\mathbf{p}_{1}} \dots a_{\mathbf{p}_{A-2}} a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}_{A-1}} a_{\mathbf{p}_{A}} a_{\mathbf{p}} |\Phi\rangle \qquad = \dots$$

$$(9)$$

$$= \sum_{i=1}^{A} \delta(\mathbf{p} - \mathbf{p}_i) \langle \mathbf{p}_1 \dots \mathbf{p}_A | \Phi \rangle + (-1)^A \underbrace{\langle 0 | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}_1} \dots a_{\mathbf{p}_A} a_{\mathbf{p}} | \Phi \rangle}_{=0}$$
(10)

Hence,

$$\langle \Phi | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle = \int d^{3} \mathbf{p}_{1} \dots d^{3} \mathbf{p}_{A} \langle \Phi | \mathbf{p}_{1} \mathbf{p}_{2} \dots \mathbf{p}_{A} \rangle \sum_{i=1}^{A} \delta(\mathbf{p} - \mathbf{p}_{i}) \langle \mathbf{p}_{1} \mathbf{p}_{2} \dots \mathbf{p}_{A} | \Phi \rangle$$
(11)

If $|\Phi\rangle$ is a slater determinant of orthonormal single particle wave functions $|\phi_{\alpha_i}\rangle$ we get,

$$\langle \Phi | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle = \sum_{i=1}^{A} |\langle \mathbf{p} | \phi_{\alpha_i} \rangle|^2 = \sum_{i=1}^{A} \phi_{\alpha_i}^{\dagger}(\mathbf{p}) \phi_{\alpha_i}(\mathbf{p})$$
(12)

Note that we also could have derived this result by instead of inserting the unit $\prod_{i=1}^{A} d^{3}\mathbf{p}_{i} |\mathbf{p}_{i}\rangle \langle \mathbf{p}_{i}|$ we expand $|\Phi\rangle$ in terms of single particle creation operators,

$$a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} |\Phi\rangle = a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} |\alpha_{1} \alpha_{2} \dots \alpha_{A}\rangle = a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} a_{\alpha_{1}}^{\dagger} a_{\alpha_{2}}^{\dagger} \dots a_{\alpha_{A}}^{\dagger} |0\rangle$$
(13)

The commutation relations between $a_{\mathbf{p}}$ and a_{α_i} are easily derived by expanding a_{α_i} in momentum creation operators,

$$a_{\alpha_i}^{\dagger} = \int d^3 \mathbf{k} \phi_{\alpha_i}(\mathbf{k}) a_k^{\dagger} \tag{14}$$

$$\Rightarrow a_{\mathbf{p}} a_{\alpha_i}^{\dagger} = \int d^3 \mathbf{k} \phi_{\alpha_i}(\mathbf{k}) a_{\mathbf{p}} a_{\mathbf{k}}^{\dagger} = \phi_{\alpha_i}(\mathbf{p}) - a_{\alpha_i}^{\dagger} a_{\mathbf{p}}$$
(15)

So,

$$a_{\mathbf{p}} |\Phi\rangle = a_{\mathbf{p}} a_{\alpha_1}^{\dagger} a_{\alpha_2}^{\dagger} \dots a_{\alpha_A}^{\dagger} |0\rangle = (\phi_{\alpha_1}(\mathbf{p}) - a_{\alpha_1}^{\dagger} a_{\mathbf{p}}) a_{\alpha_2}^{\dagger} \dots a_{\alpha_A}^{\dagger} |0\rangle$$
(16)

$$= \sum_{i=1}^{A} (-1)^{i-1} \phi_{\alpha_i}(\mathbf{p}) | \alpha_1 \dots \alpha_{i-1} \alpha_{i+1} \dots \alpha_A \rangle$$
(17)

The conjugate gives,

$$\langle \Phi | a_{\mathbf{p}}^{\dagger} = \sum_{j=1}^{A} (-1)^{j-1} \langle \alpha_1 \dots \alpha_{j-1} \alpha_{j+1} \dots \alpha_A | \phi_{\alpha_j}^{\dagger}(\mathbf{p})$$
 (18)

Hence,

$$\langle \Phi | a_{\mathbf{p}}^{\dagger} a_{\mathbf{p}} | \Phi \rangle = \sum_{i,j=1}^{A} (-1)^{i+j} \phi_{\alpha_{j}}^{\dagger}(\mathbf{p}) \phi_{\alpha_{i}}(\mathbf{p}) \underbrace{\langle \alpha_{1} \dots \alpha_{j-1} \alpha_{j+1} \dots \alpha_{A} | \alpha_{1} \dots \alpha_{i-1} \alpha_{i+1} \dots \alpha_{A} \rangle}_{=\delta_{ij}}$$
(19)

$$= \sum_{i} \phi_{\alpha_i}^{\dagger}(\mathbf{p}) \phi_{\alpha_i}(\mathbf{p}) \tag{20}$$

Which is exactly the same result as before.

So the one body momentum distribution is given by,

$$\langle \Phi | \hat{n}(p) | \Phi \rangle = \sum_{i=1}^{A} \frac{1}{(2\pi)^3} \int d^2 \Omega_{\mathbf{p}} \phi_{\alpha_i}^{\dagger}(\mathbf{p}) \phi_{\alpha_i}(\mathbf{p})$$
 (21)

Note that this distribution is normed to the number of particles A. To get the momentum distribution normed to unity we have to divide by A,

$$\langle \Phi | \hat{n}(p) | \Phi \rangle = \frac{1}{A} \sum_{i=1}^{A} \frac{1}{(2\pi)^3} \int d^2 \Omega_{\mathbf{p}} \phi_{\alpha_i}^{\dagger}(\mathbf{p}) \phi_{\alpha_i}(\mathbf{p})$$
 (22)

3 Nucleus

3.1 shell.h

This class contains the quantum number of a shell nlj. It has two (proton & neutron) static arrays containing all the shells.

These two arrays are initialised and deleted by the static methods Shell::initialiseShells, Shell::deleteShells.

3.2 nucleus.h

First important method here is Nucleus::makePairs. Note that this relies on overloaded virtual functions to function. It iterates over the quantum numbers, $n_1l_1j_1m_{j_1}, n_2l_2j_2m_{j_2}$ and makes a pair for each of these combinations: Pair::Pair(mosh,n1,l1,j1,mj1,t1,n2,l2,j2,mj2,t2). mosh is the return value of RecMosh::createRecMosh(n1,l1,n2,l2,inputdir,outputdir), being a RecMosh object. The moshinsky brackets $\langle n_1l_1n_2l_2; \Lambda|nlNL; \Lambda\rangle$ can be accessed by calling RecMosh::getCoefficient(n,l,N,L,Lambda). Open shells are taken care of by calculating a open shell correction factor and applying it to the pair via Pair::setfnorm(factor).

Once the pairs (Pair::Pair) are generated we can generate a

4 Pair coupling

4.1 pair.h

This class represents the state

$$|\alpha_1, \alpha_2\rangle_{\text{nas}} , |\alpha\rangle \equiv |nljm_j t m_t\rangle$$
 (23)

The class calculates all the coefficients,

$$C_{\alpha_1\alpha_2}^A = \langle A \equiv \{ nlSjm_j, NLM_L TM_T \} | \alpha_1\alpha_2 \rangle \tag{24}$$

The main method here is Pair::makecoeflist(). It loops over all possible values of $A \equiv \{S, T, n, l, N, M_L, j, m_j\}$. Where in the summation over $\{n, l, N, L\}$ the energy conservation $2n_1 + l_1 + 2n_2 + l_2 = 2n + l + 2N + L$ is taken into account to eliminate one of the summation loops, $L = 2n_1 + l_1 + 2n_2 + l_2 - 2n - l - 2N$. Note that M_T is also fixed by $M_T = m_{t_1} + m_{t_2}$ and no summation over this is performed, as we want to keep the contribution from different pairs separated. For each A a new object Newcoef is generated and stored in the member std::vector<NewCoef*> coeflist.

4.2 newcoef.h

This class takes the parameters $n_1l_1j_1m_{j_1}m_{t_1}n_2l_2j_2m_{j_2}m_{t_2}NLM_LnlSjm_jTM_T$, and calculates the coefficient given in Eq. (24). It takes also a pointer to a RecMosh object that holds the Moshinsky brakets. The only function in this class is to calculate $C_{\alpha_1\alpha_2}^A$ using the formula,

$$\sum_{JM_{J}} \sum_{\Lambda} \left[1 - (-1)^{L+S+T} \right] \langle t_{1} m_{t_{1}} t_{2} m_{t_{2}} | TM_{T} \rangle \langle j_{1} m_{j_{1}} j_{2} m_{j_{2}} | JM_{J} \rangle \langle j m_{j} LM_{L} | JM_{J} \rangle
\langle nlNL; \Lambda | n_{1} l_{1} n_{2} l_{2}; \Lambda \rangle_{\text{SMB}} \sqrt{2\Lambda + 1} \sqrt{2j + 1} \left\{ \begin{array}{cc} j & L & J \\ \Lambda & S & l \end{array} \right\}
\sqrt{2j_{1} + 1} \sqrt{2j_{2} + 1} \sqrt{2S + 1} \sqrt{2\Lambda + 1} \left\{ \begin{array}{cc} l_{1} & s_{1} & j_{1} \\ l_{2} & s_{2} & j_{2} \\ \Lambda & S & J \end{array} \right\}$$
(25)

It is easy to check that the result indeed depends on α_1, α_2, A . Note that it is always assumed that $s_i, t_i \equiv \frac{1}{2}$ as we are dealing with protons and neutrons. This class also defines a ''key'' to be able to index the coefficients, key = ''nlSjm_j.NLM_L.TM_T''.

4.3 paircoef.h

This is a very thin class designed to do some bookkeeping. As outlined in Maartens thesis pg 156, different $|\alpha_1\alpha_2\rangle$ combinations will sometimes map to the same "rcm" states $A = |nlSjm_jNLM_LTM_T\rangle$. In matrix element calculations,

$$\langle \alpha_1 \alpha_2 | \hat{\mathcal{O}} | \alpha_1 \alpha_2 \rangle = \sum_{AB} C_{\alpha_1 \alpha_2}^{A\dagger} C_{\alpha_1 \alpha_2}^B \langle A | \hat{\mathcal{O}} | B \rangle$$
 (26)

We want to calculate matrix elements as $\langle A|\hat{\mathcal{O}}|B\rangle$ only once. $|\alpha_1\alpha_2\rangle$ that map to the same A,Bstates should lookup the earlier calculated values for $\langle A|\hat{\mathcal{O}}|B\rangle$. In general the matrix element $\langle A|\mathcal{O}|B\rangle$ is not diagonal. A Paircoef object has all the quantum numbers in a rcm state A. In addition it holds a value and a map std::map<Paircoef*, double>. The map is used to link a rcm state $|A\rangle$ to all other rcm states $|B\rangle$ which yield a non zero contribution for $\langle A|\hat{\mathcal{O}}|B\rangle$. The value for the transformation coefficients $C_{\alpha_1,\alpha_2}^{A,\dagger}C_{\alpha_1,\alpha_2}^{B}$ is stored in the second field of the map (double). So that the summation over B (Eq. 26) is replaced by,

$$\langle \alpha_1 \alpha_2 | \hat{\mathcal{O}} | \alpha_1 \alpha_2 \rangle = \sum_{A \text{ Paircoef(A).links}} \text{link.strength} \, \langle A | \hat{\mathcal{O}} | B \rangle \tag{27}$$

Paircoef::add(double val) adds val to private member value but as far as I can see this private member value is NEVER used!

5 Matrix Elements

norm_ob: public operator_virtual_ob

Here we take a look at the calculation of the norm \mathcal{N} in norm_ob.cpp. Note that this class inherits from operator_virtual_ob, declaring general one body member functions.

- norm_ob::get_me(Pair). This calculates the matrix element meanfield matrix element sum
 - 1. $\frac{2}{A}\sum_{AB}C_{\alpha_1\alpha_2}^{A\dagger}C_{\alpha_1\alpha_2}^{B}\langle A|B\rangle$ for a pp and/or nn pair(s) (isospin $M_T=\pm 1$) 2. $\frac{1}{A}\sum_{AB}C_{\alpha_1\alpha_2}^{A\dagger}C_{\alpha_1\alpha_2}^{B}\langle A|B\rangle$ for a pn pair (isospin $M_T=0$)

for a specific pair $\alpha_1\alpha_2$ passed trough Pair.

For now I have no clue why/how the factor $\frac{2}{A}(\frac{1}{A})$ in front of $\sum_{AB} C_{\alpha_1\alpha_2}^{A\dagger} C_{\alpha_1\alpha_2}^{B} \langle A|B\rangle \dots$

It is possible to filter on relative quantum numbers on n_A, l_A, n_B, l_B , selecting specific contributions nAs, lAs, nBs, lBs to the sum. A value of -1 for these variables is interpreted as "all values allowed". Trough the braket $\langle A|B\rangle$ we already have $n_A=n_B:=n,\,l_A=l_B:=l.$

- if (nAs > -1 && nBs > -1) This forces nAs = nBs = n. So for nAs \neq nBs we will get
- if (nAs == -1 && nBs > -1) This forces nBs = n. Selecting a specific $n = n_A = n_B$ contribution.
- if (nAs > -1 && nBs == -1) This forces nAs = n. Selecting a specific $n = n_A = n_B$ contribution.
- if (nAs == -1 && nBs == -1) This makes no restrictions on $n = n_A = n_B$.

The exact same is valid for $l = l_A = l_B$ and las,1Bs. A few examples (nas,1As,nBs,1Bs):

- (-1, 2,-1,-1): allow all $n=n_A=n_B$ values. Restriction on $l=l_A=l_B=2$.
- (-1, 2,-1, 2): allow all $n=n_A=n_B$ values. Restriction on $l=l_A=l_B=2$.

As the unrestricted sum $\sum_{AB} C^{A\dagger}_{\alpha_1\alpha_2} C^B_{\alpha_1\alpha_2} \langle A|B \rangle = \sum_A |C^A_{\alpha_1\alpha_2}|^2$ equals 1, the return value of get_me (for the unrestricted sum) is,

- $-\frac{2}{A}$ with no restriction on the isospin (norm_ob::norm_ob_params.t = 0)
- $-\frac{2}{A}$ for pp-pairs, $\frac{1}{A}$ for pn-pairs and 0 for nn-pairs for a proton (norm_ob::norm_ob_params.t = 1)
- 0 for pp-pairs, $\frac{1}{A}$ for pn-pairs and $\frac{2}{A}$ for nn-pairs for a neutron (norm_ob::norm_ob_params.t =-1)

If we sum over all the pairs $\sum_{pair in pairs} norm::ob_get_me(pair,...)$ we get,

- $-\frac{A(A-1)}{2}\frac{2}{A}=A-1$ with no restriction on the isospin (norm_ob::norm_ob_params.t = 0)
- $-\frac{Z(Z-1)}{2}\frac{2}{A}+NZ\frac{1}{A}+\frac{N(N-1)}{2}0=Z\frac{A-1}{A} \text{ for a proton (norm_ob::norm_ob_params.t = 1)}$
- $-\frac{Z(Z-1)}{2}0+NZ\frac{1}{A}+\frac{N(N-1)}{2}\frac{2}{A}=N\frac{A-1}{A} \text{ for a neutron (norm_ob::norm_ob_params.t =-1)}$

Open shellness not taken into account here. Must be done somewhere else (higher up)...

For closed shell nuclei everything seems fine. For open shells however we get some strange results. For example 27 Al with 13 protons and 14 neutrons has an open $1d\frac{5}{2}$ proton shell. Open-shell nuclei are treated as closed shell but the pairs in the open shells get a weight factor. This weight factor however is **not** present in the method norm::ob_get_me(pair,...). Hence as A=27 but the closed shell equivalent with A=28 causes the number of pairs to be $28 \cdot 27/2$ instead of $27 \cdot 26/2$. We get

- $-\frac{28\cdot27}{2}\frac{2}{27}=28 \text{ (norm_ob::norm_ob_params.t = 0)}$
- $-\ \, \frac{14\cdot 13}{2}\frac{2}{27}+\frac{14\cdot 14}{27}=\frac{378}{27}=14\ (\texttt{norm_ob::norm_ob_params.t=1})$
- $-\frac{14\cdot14}{27} + \frac{14\cdot13}{2} \cdot \frac{2}{27} = \frac{378}{27} = 14 \text{ (norm_ob::norm_ob_params.t =- 1)}$
- norm_ob::get_me_corr_right(Pair).
